APPLY CRICKET LOAM

TOP TIPS

- ✓ Make sure you brush off the dew before cutting
- ✓ Light scarification or verticutting can be carried out every two weeks in the pre-season

EXPERT ADVICE

As you continue with a heavier roller and gradually mow to a shorter cut it's time for a spring fertiliser – we tend to use VerdiCulture 11-5-5 Spring Summer Fertiliser and always recommend a liquid fertiliser on the square.

If grass at the ends is weak or bare, seed with perennial rye grass PDS Cricket Seed which is fast establishing and wears well. You may also consider a germination sheet but remember to check regularly for any diseases.

If your outfield is also used for winter sports it is essential that it is free draining with a healthy sward to reduce surface damage.

See our website page on Aeration and Decompaction for more information on Verti-Drain equipment

DENSE GRASS GROWTH

At this time of the year we often use a Koro 1.2M Scarifier/Collector nutrient penetration.

DRY SPRING ACTIVITY

During a dry spring we'll take the opportunity to apply some cricket loam and recommend one of the Loam products.

ROOT DEVELOPMENT

Consider a low nitrogen, higher potassium feed like Activator 18-2-12 +1%Fe Mini Granule for root development.
